Data and Persistence

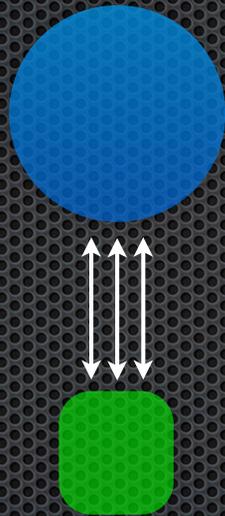

Messaging Options

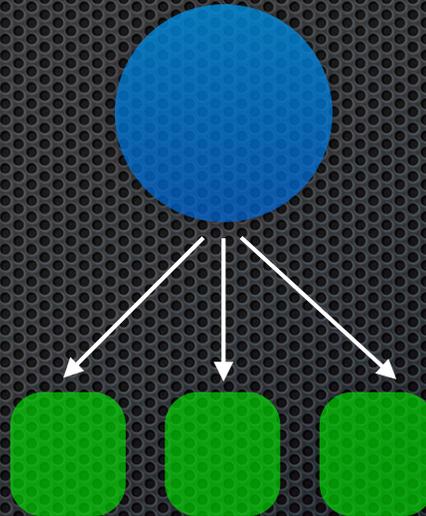

Handler

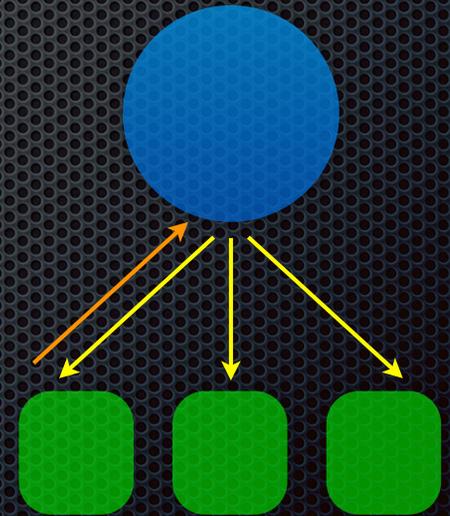

Delegate

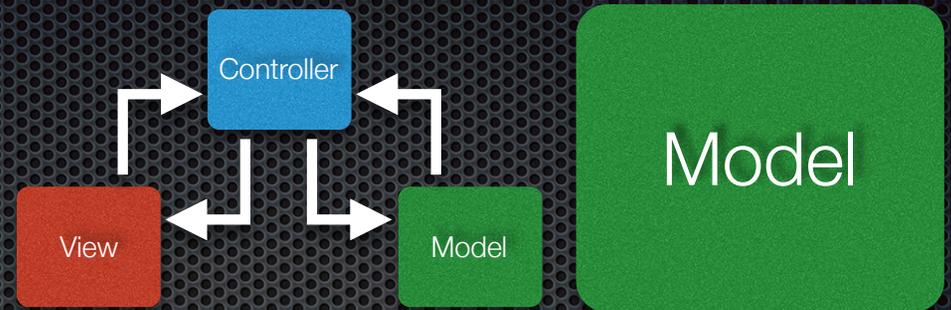

Handler Collection

Notification Center

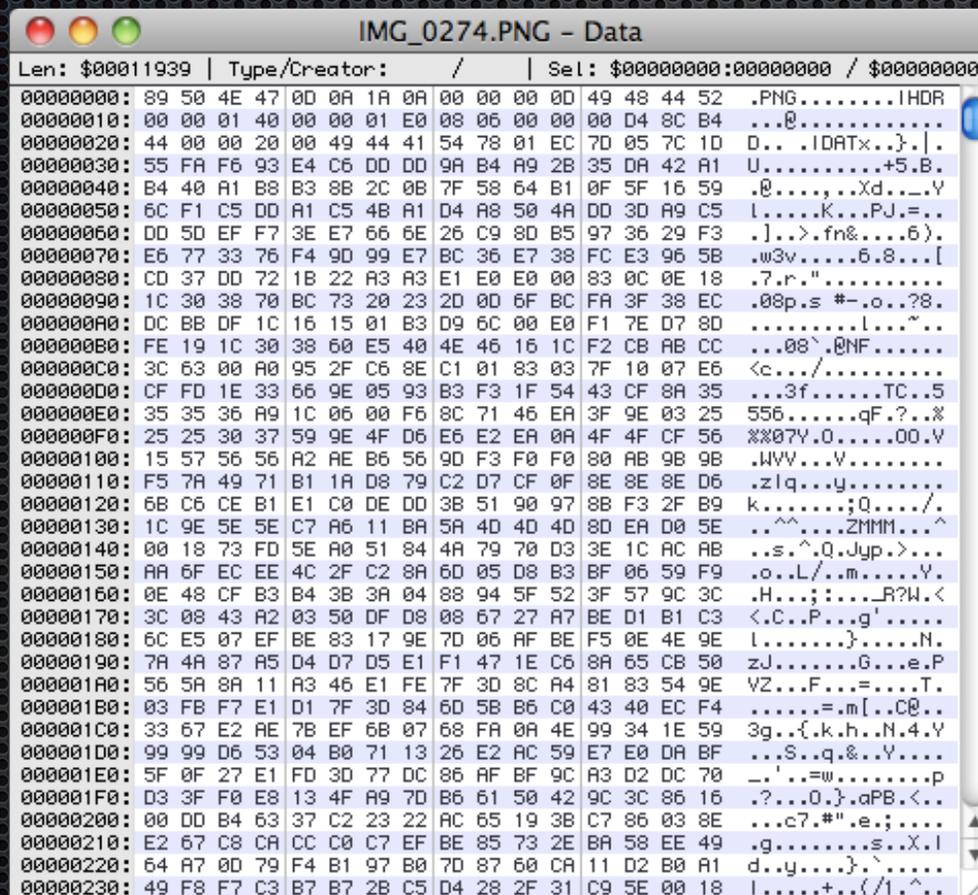

The Model

- ✦ Source of data for the application
- ✦ Contains all or nearly all of the program's state
- ✦ Should be thought of as persistent, that is, it stays the same over separate runs of the program
- ✦ Could be specifics of a running simulation, network and caching code for interfacing with a server, interface into a database running on the phone itself, or a simple object that saves the state of the app to file

`NSData(contentsOfFile:)`
`data.writeToFile(path: atomically:)`
`NSString(data:, encoding:)`

Easy to initiate,
Difficult to use

XML

<?xml?>

- ✦ iOS offers NSXMLParser, an **event-driven** XML parser
- ✦ Parses an XML document, reporting what items it encounters **as it reads** the document (streaming parser)
- ✦ Consumes **very little memory** parsing even the largest of XML documents and is very efficient
- ✦ Offers **no schema validation**

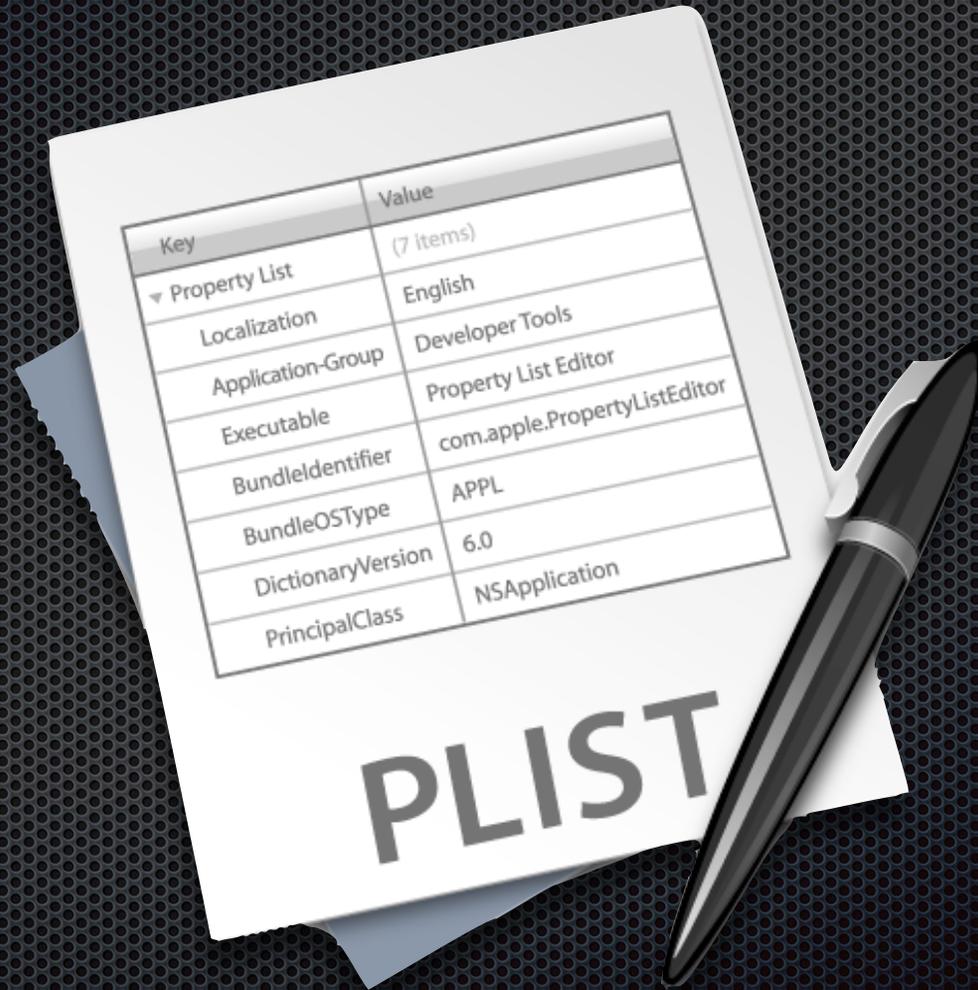

XML

<?xml?>

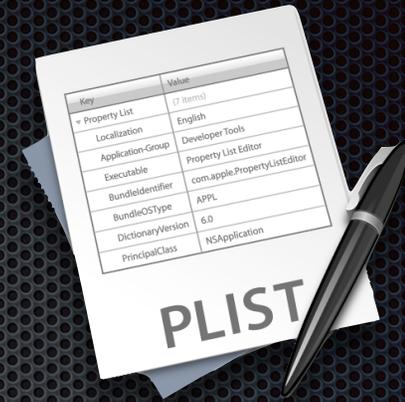

```
// Somewhere in a class declared as an NSXMLParserDelegate
let parser = NSXMLParser(contentsOfURL: NSURL(string: "http://www.google.com"))
parser?.delegate = self
parser?.parse()

// Include these methods, which are called as parsing progresses
func parserDidStartDocument(parser: NSXMLParser!) { /* ... */ }
func parserDidEndDocument(parser: NSXMLParser!) { /* ... */ }
func parser(parser: NSXMLParser!, didStartElement elementName: String!,
            namespaceURI: String!, qualifiedName qName: String!,
            attributes attributeDict: [NSObject : AnyObject]!) { /* ... */ }
func parser(parser: NSXMLParser!, foundCharacters string: String!) { /* ... */ }
func parser(parser: NSXMLParser!, didEndElement elementName: String!,
            namespaceURI: String!, qualifiedName qName: String!) { /* ... */ }
```

```
NSArray(contentsOfFile: "file.plist")  
array.writeToFile("file.plist", atomically: true)
```

Foundation class	CoreFoundation type	XML Tag	Storage format
NSString	CFString	<string>	UTF-8 encoded string
NSNumber	CFNumber	<real>, <integer>	Decimal string
NSNumber	CFBoolean	<true />, or <false />	No data (tag only)
NSDate	CFDate	<date>	ISO 8601 formatted string
NSData	CFData	<data>	Base64 encoded data
NSArray	CFArray	<array>	Can contain any number of child elements
NSDictionary	CFDictionary	<dict>	Alternating <key> tags and plist element tags

NSUserDefaults

NSUserDefaults.standardUserDefaults()

NSUserDefaults.standardUserDefaults().boolForKey("key")

NSUserDefaults.standardUserDefaults().integerForKey("key")

NSUserDefaults.standardUserDefaults().floatForKey("key")

NSUserDefaults.standardUserDefaults().objectForKey("key")

NSUserDefaults.standardUserDefaults().setBool(value, forKey:"key")

NSUserDefaults.standardUserDefaults().setInteger(value, forKey:"key")

NSUserDefaults.standardUserDefaults().setFloat(value, forKey:"key")

NSUserDefaults.standardUserDefaults().setObject(value, forKey:"key")

NSUserDefaults.standardUserDefaults().removeObjectForKey("key")

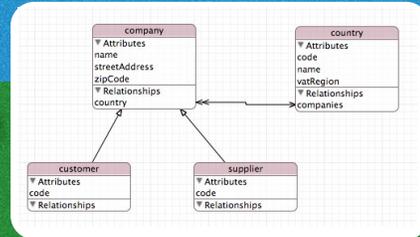

CoreData

- ✦ Core Data is an **in-memory object graph** that can be persisted to non-volatile storage
- ✦ Core Data keeps track of “**managed**” objects that contain the data for an application
- ✦ Core Data only loads data from storage **when needed** by a managed object, and keeps track of changes so they can all be **saved at one time**.
- ✦ Can use **SQLite** or other file types as the data store
- ✦ Visual schema editor available in Xcode

NSManagedObjectContext

- entities ↴

NSEntityDescription

- name (NSString)

- properties ↴

NSArray

NSAttributeDescription

- name (NSString) - optional (BOOL)
- attributeType (eg. NSFloatAttributeType)

NSAttributeDescription

- name (NSString) - optional (BOOL)
- attributeType (eg. NSFloatAttributeType)

NSManagedObject

object.valueForKey("key")
object.setValue(value forKey:"key")

NSManagedObjectContext

- persistentStoreCoordinator ↴

NSPersistentStoreCoordinator

- store initWithManagedObjectContext:model]
- store.addPersistentStoreWithType(
configuration: nil
URL: fileUrl
options: nil
error: nil)

context.save(nil)

let results =

context.executeFetchRequest(request,
error: nil)

NSFetchRequest

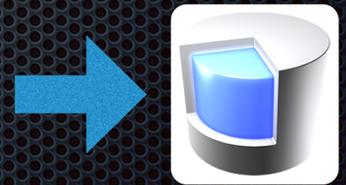

- entity (NSEntityDescription)
- predicate (NSPredicate)
- sortDescriptors (NSArray)

Creating Managed Objects

NSManagedObject

```
let object: NSManagedObject = NSEntityDescription.  
insertNewObjectForEntityForName("EntityName"  
inManagedObjectContext: context)
```

OR

```
let results: NSArray = context(  
executeFetchRequest:request  
error: nil)
```

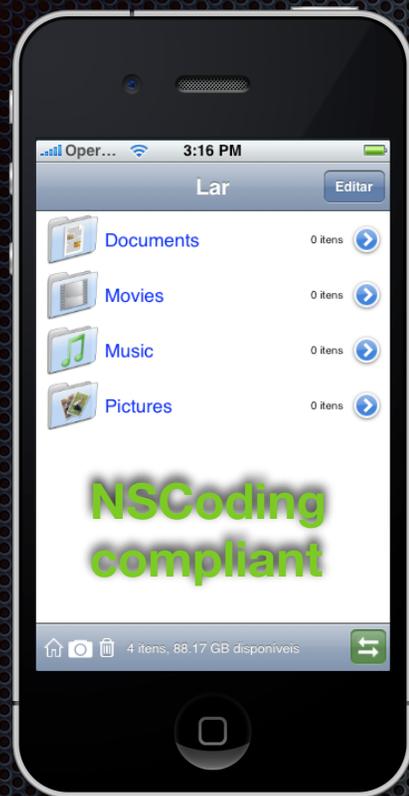

Persistence and Serialization

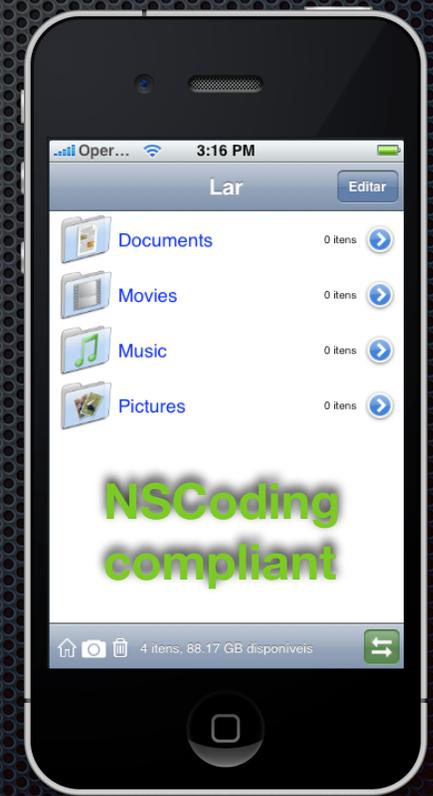

- ✦ Objects can be very easily saved to file or sent over a network socket if they are serializable
- ✦ Any object that implements the **NSCoding** protocol can be serialized using an **NSKeyedArchiver** and de-serialized with an **NSKeyedUnarchiver**

Persistence and Serialization

NSData

NSKeyedArchiver

NSKeyedUnarchiver

Model View Controller
